

Cody Johnson

Technical Product Owner · Software Engineer · Digital & Operational Systems

Austin, Texas [LinkedIn](#) [GitHub](#) [cody-johnson.com](#)

Technical Product Owner and Software Engineer with experience across technical operations, real-time systems, data collection and validation, software testing, troubleshooting, and process improvement. Hands-on background building and improving software systems, analyzing operational and performance data, reproducing and documenting issues, defining validation criteria, and improving reliability based on observed behavior.

Experienced partnering with engineering and QA teams to investigate failures, validate changes, and support technically complex operational workflows. Brings extensive hands-on motorsports experience and familiarity with vehicle setup, track environments, simulator systems, telemetry, and performance data.

EXPERIENCE

Lambda Curry

Product Owner (Contract, Full-time)

MAY 2025 - FEB 2026

- Guided multiple software products across consumer, e-commerce, B2B, and healthcare domains through requirements definition, development, testing, release, and iteration.
- Partnered with engineering and QA to reproduce issues, compare expected and actual behavior, identify edge cases, assess impact, and validate completed changes.
- Translated business goals, user behavior, product data, and stakeholder feedback into technical requirements, user stories, acceptance criteria, and prioritized work.
- Wrote PRDs and detailed requirements documenting workflows, dependencies, failure conditions, edge cases, validation criteria, and success metrics.
- Triageed defects by confirming reproduction conditions, documenting observed behavior, assessing severity and business impact, and coordinating resolution.
- Defined requirements and success criteria for a checkout redesign that contributed to a 12% first-week sales lift.
- Used behavioral data, conversion trends, and retention patterns to prioritize fixes and product improvements, driving 10-25% retention improvement across a multi-product platform.

CTX Motoworks

Assistant General Manager (Part-time, Operations & E-commerce)

JUL 2025 - MAY 2026

- Owned and improved service, inventory, customer communication, repair tracking, billing, and operational workflows in a high-volume motorcycle dealership environment.

- Monitored repair status, vehicle readiness, queue age, service capacity, and operational bottlenecks to identify issues requiring investigation or corrective action.
- Analyzed service capacity, aging work, revenue trends, and throughput to prioritize workflow and staffing changes, contributing to a \$90,000 service revenue increase in one month.
- Investigated recurring service and workflow problems, documented findings, and coordinated resolution across technicians, service advisors, parts staff, and management.
- Gathered feedback across sales, service, parts, customers, and leadership to identify workflow failures, clarify ownership, and define process improvements.
- Defined product direction and requirements for an internal dealership platform connecting customer messaging, service workflows, payments, inventory, task ownership, and management reporting. That platform became Attend, listed under projects below.

Humane Society of New Braunfels (HSNBA)

Software Engineer (Volunteer, Full-stack & SQL Automation)

APR 2024 - PRESENT

- Built Python and SQL tools for collecting, cleaning, validating, and processing operational data, reducing manual data entry by 65% and data errors by 95%.
- Built repeatable workflows to process and classify more than 19,000 animal-control records for reporting, geospatial analysis, grant planning, and operational decision-making.
- Developed validation logic to identify missing, inconsistent, duplicate, and incorrectly classified records before downstream analysis.
- Integrated external GIS datasets and APIs into internal systems to automate classification and reporting.
- Investigated data-quality issues and documented transformation rules, validation logic, and system behavior to improve reliability, auditability, and maintainability.

PROJECTS

Oasis Race Control

Real-time sim racing operations platform

PRODUCT ENGINEER / PM

.NET, PostgreSQL, real-time data, iRacing SDK, distributed systems

- Defined and built a real-time platform connecting 20+ simulator stations, driver sessions, timing data, customer displays, and venue staff.
- Integrated live session and telemetry data from the iRacing SDK and designed workflows for reliable event capture, delivery, and storage.
- Defined system behavior for simulator disconnects, application restarts, interrupted data delivery, incomplete sessions, duplicate events, and recovery scenarios.
- Designed safeguards to prevent conflicting simulator assignments and maintain data consistency during continuous venue operation.

- Troubleshoot software and integration issues by tracing behavior across client applications, event delivery, backend services, and simulator systems.
- Prioritized reliability improvements based on real-world operator behavior, simulator failures, reconnects, and live-session edge cases.

Trackday Tuner

AI-assisted race setup and session platform

PRODUCT ENGINEER / PM

Next.js, TypeScript, Supabase, Tailwind CSS, OpenAI

- Defined and built a motorsports data platform for recording vehicle setup, track conditions, rider observations, session performance, and setup changes.
- Designed structured data models connecting suspension settings, vehicle configuration, environmental conditions, rider feedback, and historical outcomes.
- Built workflows for comparing setup changes against observed vehicle behavior and performance across sessions.
- Developed retrieval-based analysis grounded in historical session and setup data rather than generic recommendations.
- Designed the product around real-world trackside workflows where consistent observations, rapid data capture, and comparison between runs are critical.

Attend

Internal dealership operations & messaging platform

PRODUCT ENGINEER / PM

React, TypeScript, Node.js, PostgreSQL, operational analytics

- Defined and built a shared operations platform for service teams managing customer communication, follow-up work, service updates, tasks, and parts notifications.
- Translated recurring operational failures into workflows for task ownership, communication tracking, escalation, customer records, and workload visibility.
- Designed AI-assisted workflows that summarize conversations, identify likely next actions, and prioritize work based on urgency.
- Used operational patterns and staff feedback to identify missed follow-ups, stalled work, ownership gaps, delayed responses, and reliability improvements.

TECHNICAL SKILLS

Programming & systems

Testing & troubleshooting

Python, TypeScript, JavaScript, .NET, Node.js, Express.js, React, REST APIs, distributed systems, real-time systems.

Software testing, defect triage, issue reproduction, root cause analysis, UAT, acceptance criteria validation, Playwright, Vitest, production support.

Data & analysis

SQL, PostgreSQL, MongoDB, data collection, data validation, data quality, operational metrics, reporting, behavioral data, data workflows.

Product & engineering

Technical requirements, user stories, acceptance criteria, PRDs, backlog management, release validation, cross-functional engineering collaboration, Agile, Scrum, Jira, Linear.

AI & automation

LLM API integration, RAG, agentic workflows, vector databases, embeddings, LangChain, MCP.

Motorsports & simulation

iRacing SDK, simulator systems, telemetry, performance data, vehicle setup, suspension setup, track environments.

Other

Tailwind CSS, shadcn/ui, Figma, Unity.

EDUCATION & CERTIFICATIONS

- M.S. Computer Science (in progress), University of Colorado Boulder
- B.S. Advertising, Texas State University
- Harvard CS50
